# Experiment - 5

**Student Name:** Harjit Singh **UID:** 23BCS10849
**Branch:** BE-CSE **Section/Group:** KRG_2B
**Semester:** 5th **Date of Performance:** 22/9/25
**Subject Name:** Advanced Database and Management System
**Subject Code:** 23CSP-333

## 1. Problem Description/Aim:

**Medium-Problem Title:** Generate 1 million records per ID in 'transaction_data' using generate_series() and random() ,create a normal view and a materialized view 'sales_summary' with aggregated metrics (total_quantity_sold , total_sales, total_orders) , and compare their performance and execution time.

**Procedure (Step-by-Step):**

1. Create a large dataset:
   - Create a table names transaction_data (id , value) with 1 million records.
   - take id 1 and 2, and for each id, generate 1 million records in value column
   - Use Generate_series () and random() to populate the data.
2. Create a normal view and materialized view to for sales_summary, which includes total_quantity_sold, total_sales, and total_orders with aggregation.
3. Compare the performance and execution time of both.

**Sample Output Description:**

The transaction_data table has 2 million rows (1 million per ID) with random values. The normal view sales_summary computes aggregates on the fly, while the materialized view sales_summary_mv stores precomputed results. Queries on the materialized view are much faster, but it needs refreshing when data changes, whereas the normal view always shows up-to-date results.

**Hard-Problem Title: Create restricted views in the sales database to provide summarized, non-sensitive data to the reporting team, and control access using DCL commands( GRANT and REVOKE).**

**Procedure (Step-by-Step):**

1. Create restricted views-
   - Define views that show only **aggregated sales data** (e.g., total_sales, total_orders) without exposing sensitive columns like customer details or payment info.

2. Assign access to reporting team(or client)-
   -Use "GRANT SELECT ON view_name TO reporting_user; " to give access.
3. Revoke access if needed.
   -Use "REVOKE SELECT ON view_name FROM reporting_user;" to remove access.
4. Verify access
   - Reporting users can query the view but cannot access base tables directly, ensuring security.

**Sample Output Description:**

The result shows the restricted view providing summarized sales data only like
- Columns shown are - product_id,total_quantity_sold, total_sales, total_orders
- Columns hidden are - Customer names, addresses, payment details

A reporting user querying the view sees something like :
- Product 101 - 5000 units sold, total sales Rs. 12,50,000,500 orders.
- Product 102 - 3200 units sold, total sales Rs. 8,60,000,320 orders.

When the user tries to query the base "sales_transactions" table directly, access is denied, enforcing security.

2. **Objective:** To design and implement secure, efficient data access mechanisms by creating large-scale transaction datasets, summarizing them through normal and materialized views for performance comparison, and enforcing restricted access to sensitive data using views and DCL commands.

## 3. SQL QUERY AND OUTPUTS -

**----------MEDIUM LEVEL PROBLEM----------**

```
Create table TRANSACTION_DATA(id int,val decimal);
INSERT INTO TRANSACTION_DATA(ID,VAL)
SELECT 1,RANDOM()
FROM GENERATE_SERIES(1,1000000);

INSERT INTO TRANSACTION_DATA(ID,VAL)
SELECT 2,RANDOM()
FROM GENERATE_SERIES(1,1000000);
SELECT * FROM TRANSACTION_DATA;
```

```
CREATE or REPLACE VIEW SALES_SUMMARY AS
SELECT
ID,
COUNT(*) AS total_quantity_sold,
sum(val) AS total_sales,
count(distinct id) AS total_orders
FROM TRANSACTION_DATA
GROUP BY ID;

EXPLAIN ANALYZE
SELECT * FROM SALES_SUMMARY;

CREATE MATERIALIZED VIEW SALES_SUMM AS
SELECT
ID,
COUNT(*) AS total_quantity_sold,
sum(val) AS total_sales,
count(distinct id) AS total_orders
FROM TRANSACTION_DATA
GROUP BY ID;

EXPLAIN ANALYZE
SELECT * FROM SALES_SUMM;
```

SQL | Showing rows: 1

| | QUERY PLAN text |
|---|---|
| 1 | Seq Scan on sales_summ (cost=0.00..20.20 rows=1020 width=52) (actual time=0.017..0.018 rows=2 loops=... |
| 2 | Planning Time: 0.063 ms |
| 3 | Execution Time: 0.032 ms |

OUTPUT -
As we can see that the execution time using the materialized view is very less as compared to the simple view's execution time.

----------**HARD PROBLEM** ----------

```
CREATE TABLE customer_data (
    transaction_id SERIAL PRIMARY KEY,
    customer_name VARCHAR(100),
    email VARCHAR(100),
    phone VARCHAR(15),
    payment_info VARCHAR(50),  -- sensitive
    order_value DECIMAL,
    order_date DATE DEFAULT CURRENT_DATE
);

-- Insert sample data
INSERT INTO customer_data (customer_name, email, phone, payment_info, order_value)
